1. **Select a mathematical description or a representation that describes a problem (0.1.1)**
   - The core requirement of this problem is for students to judge which of the four given mathematical formulas can correctly describe the real-world situation where the "normal selling price (s) includes a profit of 37.5%, and the profit is calculated as a percentage of the wholesale price (w)". This directly asks students to "select a mathematical description or representation" from the options provided to accurately model the problem.
2. **Translate a problem into a standard mathematical representation or algorithm**
   - Although this involves selection rather than construction, students must understand how the linguistic description in the real world ("profit is calculated as a percentage of the wholesale price") translates into the correct algebraic equation (e.g., $s = 1.375w$). This process involves "translating" natural language descriptions into standard mathematical form.
3. **Read, decode and make sense of statements, questions, tasks, objects or images to create a model of the situation (0.1.1)**
   - Students need to carefully read and understand the critical description in the text regarding the "basis for profit calculation" (based on wholesale price, not selling price), as well as the definitions of variables w and s, to correctly evaluate each formula's correctness. This is a prerequisite for creating or identifying the correct model.
4. **Identify and describe the mathematical aspects of a real-world problem situation including identifying the significant variables (0.1.1)**
   - Students must identify the key mathematical aspects of the situation: the existence of two prices (wholesale price w and selling price s), a profit margin (37.5%), and their specific relationship. Recognizing these variables and their relationship is fundamental to judging the formulas' correctness.
5. **Recognise aspects of a problem that correspond with known problems or mathematical concepts, facts or procedures (0.1.1)**
   - This problem requires students to recognize that this is a percentage and proportion problem involving the concept of "increasing by a certain percentage". The correct formulas $s = w + 0.375w$ or $s = 1.375w$ rely on recognizing these basic mathematical concepts.

1. **Select a mathematical description or a representation that describes a problem (0.1.1)**
   - 这个问题的核心要求是，学生需要判断四个给出的数学公式中，哪一个或哪几个能够正确地描述“正常售价（s）包含 37.5% 的利润，且利润是按批发价（w）计算”这一现实情境。这直接要求学生从提供的选项中“选择一个数学描述或表示”来准确地建模问题。
2. **Translate a problem into a standard mathematical representation or algorithm**
   - 虽然这里是选择而非构建，但学生必须理解现实世界中的语言描述（“利润是按批发价的百分比计算”）如何转化为正确的代数方程式（例如 $s = 1.375w$）。这个过程涉及将自然语言描述“翻译”成标准的数学形式。
3. **Read, decode and make sense of statements, questions, tasks, objects or images to create a model of the situation (0.1.1)**
   - 学生需要仔细阅读并理解文本中关于“利润率计算基准”（按批发价而非售价）的关键描述，以及变量 w 和 s 的定义，才能正确评估每个公式的正确性。这是创建或识别正确模型的前提。
4. **Identify and describe the mathematical aspects of a real-world problem situation including identifying the significant variables (0.1.1)**
   - 学生必须识别出情境中的关键数学方面：存在两种价格（批发价 w 和售价 s）、一个利润率（37.5%），以及它们之间的特定关系。识别这些变量及其关系是判断公式正确性的基础。
5. **Recognise aspects of a problem that correspond with known problems or mathematical concepts, facts or procedures (0.1.1)**
   - 这个问题要求学生识别出这是一个百分比和比例问题，涉及“增加一定百分比”的概念。正确的公式 $s = w + 0.375w$ 或 $s = 1.375w$ 依赖于对这些基本数学概念的认识。
