1. **Perform a simple calculation (1. Perform a simple calculation)**
   - This problem requires first calculating the minimum permissible distance between wind power station towers ($5 \times 40 \text{ m} = 200 \text{ m}$), and then comparing it to the distance shown in the mayor's suggested layout diagram (which shows 250 m spacing). This is a direct multiplication calculation and comparison process.
2. **Understand and utilise constructs based on definitions, rules and formal systems including employing familiar algorithms (5. Understand and utilise constructs based on definitions, rules and formal systems including employing familiar algorithms)**
   - Students must understand and apply the rule specified in the building regulations: "the minimum distance... has to be five times the length of a rotor blade". This involves converting the text description of the rule into a concrete mathematical standard ($5 \times \text{length}$) and using basic arithmetic algorithms.
3. **Manipulate numbers, graphical and statistical data and information, algebraic expressions and equations, and geometric representations (7. Manipulate numbers, graphical and statistical data and information, algebraic expressions and equations, and geometric representations)**
   - This involves manipulating specific numbers (40 m, 5 times, 250 m) and using geometric information (square field) to analyze whether the layout complies with regulations.
4. **Articulate a solution, showing and/or summarising and presenting intermediate mathematical results (8. Articulate a solution, showing and/or summarizing and presenting intermediate mathematical results)**
   - The problem explicitly asks to "Explain why the town mayor's suggestion does not meet the building regulations. Support your arguments with calculations". This requires students not only to perform calculations but also to clearly articulate the process and conclusion to prove the non-compliance.
5. **Make sense of, relate and use a variety of representations when interacting with a problem (10. Make sense of, relate and use a variety of representations when interacting with a problem)**
   - Students need to extract key information from both the textual description of the regulation and the illustrated diagram (e.g., blade length, distance requirement, distance in the diagram) to solve the problem.
6. **Use an understanding of the context to guide or expedite the mathematical solving process, e.g. working to a context-appropriate level of accuracy (13. Use an understanding of the context to guide or expedite the mathematical solving process, e.g. working to a context-appropriate level of accuracy)**
   - Understanding that the problem context is about "building regulations" for wind power stations helps determine which data to use (blade length and distance requirements) and how to interpret the results (judging compliance), rather than calculating power generation or other irrelevant information.

1. **进行简单计算 (1. Perform a simple calculation)**
   - 该问题要求首先计算出风力发电站塔基最小间距 ($5 \times 40\ \mathrm{m} = 200\ \mathrm{m}$)，然后将其与市长建议的布置图（显示 250 m 间距）进行比较 (p. 1)。这是一个直接的乘法计算和比较过程。
2. **理解和利用基于定义、规则和形式系统的结构，包括使用熟悉的算法 (5. Understand and utilise constructs based on definitions, rules and formal systems including employing familiar algorithms)**
   - 学生必须理解并应用建筑规范中规定的“最小距离是转子叶片长度的五倍”这条规则 (p. 1)。这涉及将文字描述的规则转化为具体的数学标准（$5 \times \mathrm{length}$），并使用基本的算术算法。
3. **操作数字、图形和统计数据及信息、代数表达式和方程式、以及几何表示 (7. Manipulate numbers, graphical and statistical data and information, algebraic expressions and equations, and geometric representations)**
   - 这涉及操作具体的数字（40 米、5 倍、250 米）并使用几何信息（正方形场地）来分析布局是否符合规定 (p. 1)。
4. **阐明解决方案，展示和/或总结并呈现中间数学结果 (8. Articulate a solution, showing and/或 summarizing and presenting intermediate mathematical results)**
   - 题目明确要求“解释为什么市长的建议不符合建筑规定。用计算支持你的论点” (p. 1)。这要求学生不仅要进行计算，还要清晰地阐述计算过程和结论，以证明不合规的原因。
5. **理解文本 (10. Make sense of, relate and use a variety of representations when interacting with a problem)**
   - 学生需要从文字描述的规定和图示的布局中提取关键信息（例如叶片长度、距离要求、图中的间距）来解决问题 (p. 1)。
6. **使用理解的上下文来指导或加快数学解决过程 (13. Use an understanding of the context to guide or expedite the mathematical solving process, e.g. working to a context-appropriate level of accuracy)**
   - 理解问题的背景是关于风力发电站的“建筑规定”，这有助于确定需要使用哪些数据（叶片长度和距离要求）以及如何解释结果（判断是否合规），而不是去计算发电量或其他无关信息。
