(1) 3. Implement a given strategy to determine a mathematical solution

The question explicitly provides the strategy: "the wind speed at 150m height is approximately 25% higher than on the deck." The test-taker must directly apply this strategy to calculate the wind speed, which fully matches "implementing a given strategy to determine a mathematical solution."

(2) 1. Perform a simple calculation

The core of the problem is a simple percentage calculation:
Deck wind speed: $24\ \mathrm{km/h}$
Increase at height: 25%
Calculation: $24 \times 1.25 = 30\ \mathrm{km/h}$
This is a basic arithmetic operation.

(3) 7. Manipulate numbers, graphical and statistical data and information, algebraic expressions and equations, and geometric representations

While this problem does not involve complex algebra or geometry, it does involve "numerical and percentage manipulation," which falls under processing and transforming numerical information.

(4) 13. Use an understanding of the context to guide or expedite the mathematical solving process

The problem is set in the real-world context of "using kite sails to reduce ship fuel consumption." The test-taker must understand the physical background—"wind speed is higher at altitude"—and use it to choose the correct calculation method.

(5) 12. Use a multi-step procedure leading to a mathematical solution, conclusion or generalisation

Although simple, the solution still involves:
① Understanding the meaning of "25% higher";
② Converting this into a multiplication operation;
③ Selecting the correct answer.
This constitutes a simple yet complete multi-step process.

(6) 8. Articulate a solution, showing and/or summarising and presenting intermediate mathematical results

The problem is a multiple-choice question and does not require showing the process. However, in a teaching context, students might need to explain the calculation steps, so it has some relevance to "articulating a solution."

(1) 3. Implement a given strategy to determine a mathematical solution

题目明确给出了“风在150米高处风速比甲板高25%”这一策略，要求考生直接应用此策略计算风速，完全匹配“实施给定策略以得出数学解”。

(2) 1. Perform a simple calculation

题目本质是一个简单的百分比计算：
甲板风速 $24\ \mathrm{km/h}$
高处风速增加 25%
计算：$24 \times 1.25 = 30\ \mathrm{km/h}$
属于基础算术运算。

(3) 7. Manipulate numbers, graphical and statistical data and information, algebraic expressions and equations, and geometric representations

本题虽未涉及复杂代数或几何，但涉及“数字与百分比运算”，属于对数值信息的处理与转换。

(4) 13. Use an understanding of the context to guide or expedite the mathematical solving process

题目设定在“风帆助力船舶减少油耗”的实际情境中，考生需理解“高处风速更大”这一物理背景，并据此选择正确计算方式。

(5) 12. Use a multi-step procedure leading to a mathematical solution, conclusion or generalisation

解题虽简单，但仍包含：
① 理解“高出25%”的含义；
② 转换为乘法运算；
③ 选择正确答案。
属于一个简单但完整的多步过程。

(6) 8. Articulate a solution, showing and/or summarising and presenting intermediate mathematical results

本题为选择题，不要求展示过程，但若在教学中，学生可能需要说明计算步骤，因此与“表达解题过程”有一定关联。
