1. Read, decode and make sense of statements, questions, tasks, or images to create a model of the situation (Refers to #4)

This is the primary and most critical step for this problem.

- **Specific Analysis**: The student must read and interpret the text on the two posters. Specifically, for the *Zedland Star*, they must understand the conditional payment structure: "0.20 zeds for the first 240 papers... plus 0.40 zeds for each additional paper." This requires turning a verbal advertisement into a logical mental model of **piece-rate pay with a threshold**. (p. 1)

2. Identify and describe the mathematical aspects of a real-world problem situation including identifying the significant variables (Refers to #6)

After understanding the text, the student must extract the mathematical "DNA" from the scenario.

- **Specific Analysis**: The student needs to filter out irrelevant information (like "NEED EXTRA MONEY?") and identify the key variables: Total Sales (350), the threshold (240), the base rate (0.20), and the bonus rate (0.40). (p. 1)

3. Simplify or decompose a situation or problem in order to make it amenable to mathematical analysis (Refers to #7)

Because the *Zedland Star* pay structure is not a simple linear multiplication, it must be broken down.

- **Specific Analysis**: Since Frederic sells 350 copies (which exceeds the 240-copy threshold), the student must **decompose** the total into two distinct parts: the first 240 copies and the remaining 110 copies ($350 - 240$). This ability to break down a complex situation is essential for the correct calculation. (p. 1)

4. Translate a problem into a standard mathematical representation or algorithm (Refers to #9)

This is the transition into the actual computation phase.

- **Specific Analysis**: The student translates the logical model into an arithmetic algorithm. For example: $(240 \times 0.20) + (110 \times 0.40)$. This step turns the real-world rules into a formal mathematical operation. (p. 1)

5. Recognise aspects of a problem that correspond with known problems or mathematical concepts, facts or procedures (Refers to #8)

- **Specific Analysis**: The student recognizes this as a **piecewise function** or a step-rate calculation. While they may not use formal function notation, the solution relies on their familiarity with these mathematical structures. (p. 1)

6. Use mathematical tools to describe the mathematical structures and/or relationships (Refers to #10/11)

- **Specific Analysis**: This is demonstrated by the student using multiplication and addition symbols to define the relationship between quantity sold and total earnings. (p. 1)

1. 解读、解码并理解陈述、问题或图像，以建立情境模型 (对应第4点)

这是解决本题的首要步骤，也是最核心的能力点。

- **具体分析**：学生必须阅读并理解两张海报上的文字信息。特别是《Zedland Star》的工资结构："前240份每份0.20 zeds，超过部分每份0.40 zeds" (p. 1)。学生需要将这段文字描述转化为脑中的逻辑模型，理解这是一个**分段计费**的结构。

2. 识别现实世界问题情境中的数学方面，包括识别重要变量 (对应第6点)

在理解文字后，学生需要从生活情境中提取出数学元素。

- **具体分析**：学生需要识别出关键变量：销售总量（350份）、分界点（240份）、第一阶段单价（0.20）、第二阶段单价（0.40） (p. 1)。题目考查了学生从广告文案中过滤无关信息（如"NEED EXTRA MONEY?"），精准提取数学参数的能力。

3. 为使数学分析成为可能，对情境或问题进行简化或分解 (对应第7点)

由于《Zedland Star》的工资不是单一倍数关系，必须进行分解。

- **具体分析**：由于Frederic卖了350份，超过了240份的门槛，学生必须将350这个总量分解为两部分：240（基础部分）和 $350 - 240 = 110$（额外部分） (p. 1)。这种**分解复杂问题**的能力是得出正确答案的关键。

4. 将问题转化为标准的数学表示或算法 (对应第9点)

这是进入计算阶段的必经之路。

- **具体分析**：学生需要将文字逻辑转化为算式。例如：$240 \times 0.20 + (350 - 240) \times 0.40$。这个过程是将现实中的支付规则转化为数学算法的过程。

5. 识别与已知问题或数学概念、事实、程序相对应的方面 (对应第8点)

- **具体分析**：学生需要联想到数学中的**分段函数**概念或**四则运算程序**。虽然题目没要求写出函数式，但解决该题依赖于对这种比例加成逻辑的熟悉程度。

6. 使用数学工具描述问题中的数学结构和/或关系 (对应第10/11点)

- **具体分析**：这体现在学生利用乘法和加法符号来建立总量与收益之间的关系。如果学生尝试用代数式（如 $y = 0.20x$ 当 $x \leq 240$）来思考，就更体现了这一方面的应用。
