1. Read, decode and make sense of statements, questions, tasks, objects or images to create a model of the situation (Refers to #4)

This remains the foundational step for the problem. (p. 1)

- **Specific Analysis**: The student must extract the specific pay structure for *Zedland Daily* from the poster: "60 zeds a week, plus an additional 0.05 zeds per newspaper." They must then integrate this with the new information provided in the prompt: Christine's total earnings of 74 zeds. (p. 1)

2. Translate a problem into a standard mathematical representation or algorithm (Refers to #9)

Unlike the first problem (which was a direct calculation), this requires an inverse operation or an algebraic setup.

- **Specific Analysis**: The student needs to translate the verbal rules into a mathematical equation or a multi-step algorithm.
  - **Algebraic form**: $60 + 0.05n = 74$ (where n is the number of papers).
  - **Algorithmic form**: $(74 - 60) \div 0.05$.
    Converting the concept of "Total minus Base Pay divided by Commission" into these operations is the core challenge.

3. Identify and describe the mathematical aspects of a real-world problem situation including identifying the significant variables (Refers to #6)

- **Specific Analysis**: The student must identify the fixed variable (60 zeds base pay), the rate (0.05 zeds/paper), and the dependent variable (74 zeds total income). Recognizing the **linear relationship** between these variables is essential before any math can be performed. (p. 1)

4. Recognise aspects of a problem that correspond with known problems or mathematical concepts, facts or procedures (Refers to #8)

- **Specific Analysis**: The student identifies this as a standard **linear equation problem**. The solution follows a known procedure: "Total - Base = Remainder," and "Remainder ÷ Unit Price = Quantity."

5. Identify the key variables in a model (Refers to #2)

- **Specific Analysis**: In this specific task, the "key variable" being sought is the **independent variable** (number of newspapers sold). The student must realize that while the poster gives the price, the goal of this specific question is to find the quantity that generated the given result.

6. Simplify or decompose a situation or problem in order to make it amenable to mathematical analysis (Refers to #7)

- **Specific Analysis**: The student must decompose the 74 zeds into two logical parts:
  1. The 60 zeds earned regardless of sales.
  2. The 14 zeds earned specifically from sales ($74 - 60 = 14$). This decomposition makes the final division possible.

1. 解读、解码并理解陈述、问题、任务或图像，以建立情境模型（第4点）

这是解题的起点。

- **具体分析**：学生必须从 *Zedland Daily* 的海报中提取关键信息："每周固定60 zeds，外加每份报纸0.05 zeds" (p. 1)。学生需要理解这是一种**固定值+变动值**的线性结构。同时，必须识别出题目给出的新数据：Christine 的总收入是 74 zeds (p. 1)。

2. 将问题转化为标准的数学表示或算法（第9点）

与上一题不同，本题更强调"逆向算法"或代数表达。

- **具体分析**：学生需要将文字描述转化为等式或计算流程。
  - **代数表示**：$60 + 0.05n = 74$（其中 n 是报纸数量）。
  - **逆向算法**：$(74 - 60) \div 0.05$。
    将现实中的"总工资扣除底薪再除以单价"转化为这种数学模型是解题的关键 (p. 1)。

3. 识别现实世界问题情境中的数学方面，包括识别重要变量（第6点）

- **具体分析**：学生需要识别出题目中的核心变量：固定薪资（60 zeds）、单位佣金（0.05 zeds/份）以及因变量总收入（74 zeds）。识别出这些变量之间的**逻辑联系**是建立数学模型的前提 (p. 1)。

4. 识别与已知问题或数学概念、事实、程序相对应的方面（第8点）

- **具体分析**：学生需要识别出这是一个典型的**一元一次方程应用题**。解决此类问题通常遵循"总数 - 基数 = 剩余量"，"剩余量 ÷ 单价 = 数量"的固定数学程序 (p. 1)。

5. 识别模型中的关键变量（第2点）

- **具体分析**：在本题中，未知数（Key Variable）是"销售的报纸数量"。学生必须意识到，虽然海报给了单价，但本题的任务是求出产生特定结果所需的变量值，而不是计算结果本身 (p. 1)。

6. 简化或分解情境或问题，以便进行数学分析（第7点）

- **具体分析**：学生需要将 74 zeds 的总收入分解为两个逻辑部分：
  1. 不论卖多少都能得到的 60 zeds (p. 1)。
  2. 由卖报纸产生的 14 zeds 额外收入（$74 - 60 = 14$）。这种分解使得后续的除法运算变得可行。
