1. **Point 5: Interpret mathematical outcomes in a variety of formats in relation to a situation or use; compare or evaluate two or more representations in relation to a situation.**
   The question presents data for four cars (year, price, distance) in a table format. It requires the test-taker to extract this information and compare it against a set of given conditions. This directly demonstrates the ability to interpret mathematical outcomes presented in a specific format (a table) and compare multiple data points.
2. **Point 1: Interpret a mathematical result back into the real world context.**
   After applying the conditions to the data, the conclusion is that the "Bolte" model meets all the requirements. This mathematical result must then be interpreted in the real-world context: this is the car Chris can buy. The solution translates a filtering process into a practical decision.
3. **Point 9: Understand the relationship between the context of the problem and representation of the mathematical solution. Use this understanding to help interpret the solution in context and gauge the feasibility and possible limitations of the solution.**
   To solve the problem, one must understand the real-world meaning of parameters like "distance travelled," "year of manufacture," and "advertised price." The conditions ("not higher than," "a later year") need to be translated into mathematical inequalities. This shows an understanding of how the problem's context relates to its mathematical representation.
4. **Point 7: Construct and communicate explanations and arguments in the context of the problem.**
   While the question is multiple-choice, the underlying process requires logical reasoning. One must systematically check each car against all three conditions to arrive at the correct answer (e.g., eliminating Alpha for exceeding the price limit, Dezal for being too old, and Castel for exceeding the distance limit). This process involves constructing an internal argument to justify the conclusion.

1. **第5点：解释多种格式的数学结果**
   题目以表格形式呈现了四辆车的详细数据（年份、价格、距离等），要求考生从中提取信息并与给定的条件进行比较。这体现了对多种格式（表格）的数学结果的解读和对比能力。
2. **第1点：将数学结果解释回现实情境**
   通过条件筛选得出Bolte符合所有要求后，这一结果需要被理解为Chris可以购买这辆车，即将数学结论应用于实际购车决策。
3. **第9点：理解问题背景与数学表示的关系**
   考生必须理解每个参数（如行驶距离、年份、价格）的现实意义，以及条件（“不高于”“或以后”）如何转化为数学不等式，从而将现实问题转化为数学问题。
4. **第7点：构造和传达解释**
   虽然题目是选择题，但解题过程需要逻辑推理，例如逐一检查每辆车是否满足所有条件，并最终得出结论，这隐含了构造解释的过程。
