1st: Aspect 5 (Interpret mathematical outcomes... in relation to a situation)

- **Analysis:** This is the core of the problem. It requires the student to understand mathematical data in a table (year, price, distance) and interpret the significance of these numbers based on Chris's real-world "situation" (the three specific conditions). The student must evaluate multiple representations (four car models) in relation to that situation (p. 1).

2nd: Aspect 9 (Relationship between context and representation of the solution)

- **Analysis:** The problem asks the student to bridge the gap between the real-world context (buying a car) and the mathematical representation (the data table). The student uses this understanding to gauge the "feasibility" of each solution (which car actually works) under the constraints Chris has set (p. 1).

3rd: Aspect 1 (Interpret a mathematical result back into the real world context)

- **Analysis:** The final selection (Bolte) is not just a set of numbers; it represents a real-world decision. Once the comparison is complete, the student must translate that data-driven result back into the context of which car Chris should actually purchase (p. 1).

4th: Aspect 2 (Identify whether a mathematical result... makes sense given the context)

- **Analysis:** During the filtering process, the student effectively identifies which "results" do not make sense for the buyer. For example, while the "Alpha" is newer, its price of 4800 zeds makes it an "insensible" choice given Chris's financial constraint of 4500 zeds (p. 1).

第一位：方面 5 (Interpret mathematical outcomes... in relation to a situation)

- **分析：** 这是本题的核心。题目要求学生理解表格中的数学数据（年份、价格、里程），并根据克里斯提出的现实购车“情境”（具体的三项条件）来解释这些数据的意义。学生必须评估四种汽车模型（多种呈现方式/选项），看哪一个符合现实需求 (p. 1)。

第二位：方面 9 (Understand the relationship between context... and representation of the solution)

- **分析：** 题目要求学生在“买车”这一现实背景与“表格数据”这一数学表达之间建立联系。学生需要判断哪一个数学解（具体的车型及其数据）在克里斯设定的约束条件下是“可行”（feasible）的 (p. 1)。

第三位：方面 1 (Interpret a mathematical result back into the real world context)

- **分析：** 最终选出的车型（如 Bolte）不仅仅是一个数据组合，它代表了一个真实的决策结果。学生完成计算和比较后，必须将结果回归到“克里斯该买哪辆车”这一现实问题中 (p. 1)。

第四位：方面 2 (Identify whether a mathematical result... does, or does not, make sense given the context)

- **分析：** 在筛选过程中，学生实际上是在排除“不合理”的选项。例如，Alpha 虽然年份新，但价格超过 4500 zeds，在克里斯的财务情境下是不合理的；Castel 里程过高，也不符合要求 (p. 1)。
