1️⃣ Interpret 5 (Most Relevant)

Interpret mathematical outcomes in a variety of formats in relation to a situation.

Reason

The problem presents data in a **table format**, and students must:

- Read the table
- Extract relevant information
- Compare the information with real-world constraints

For example:

Model	Year	Price	Distance
Alpha	2003	4800	105000

Students need to interpret:

- Price 4800 > 4500 → does not meet the condition.

This reflects the ability to:

interpret tabular data and relate it to real-world requirements.

Therefore, this competency is the **core skill required in this problem**.

2️⃣ Interpret 1

Interpret a mathematical result back into the real world context. interpret

Reason

The task essentially requires translating mathematical comparisons into a **real-life decision (choosing a car)**.

For example:

For **Bolte**:

- Year = 2000 ✔
- Price = 4450 ✔
- Distance = 115000 ✔

Therefore, the mathematical conclusion is:

Bolte satisfies all the conditions.

Students must interpret this result in the real-world context:

👉 **Chris should buy the Bolte car.**

This demonstrates the ability to:

translate mathematical results into real-world decisions.

3️⃣ Interpret 2

Identify whether a mathematical result makes sense given the context of a problem. interpret

Reason

Students must determine whether the result **fits the constraints of the real-world situation**.

For example:

For **Castel**:

- Distance travelled = 128000 km

This exceeds the limit of **120000 km**, therefore:

👉 The car does **not** meet the requirements.

This reflects the ability to:

judge whether a result is valid within the context of the problem.

4️⃣ Interpret 9

Understand the relationship between the context of the problem and the representation of the mathematical solution. interpret

Reason

The real-world problem (buying a car) is represented through **tabular data**.

Students must understand the relationship between:

real-world requirements → mathematical conditions

For example:

Real-world requirement	Mathematical representation
Distance ≤ 120000 km	distance ≤ 120000
Year ≥ 2000	year ≥ 2000
Price ≤ 4500	price ≤ 4500

Students interpret the data by understanding this relationship.

1️⃣ Interpret 5（相关性最高）

Interpret mathematical outcomes in a variety of formats in relation to a situation.

体现原因

题目提供的是 **表格数据表示形式**，学生需要：

- 阅读表格
- 从不同变量中提取信息
- 与现实条件进行比较

例如：

车型	Year	Price	Distance
Alpha	2003	4800	105000

学生需要解释：

- 价格4800 > 4500 → 不符合

这体现了：

对表格数据的解释，并将其与现实需求进行比较判断。

因此该能力是本题最核心的能力。

2️⃣ Interpret 1

Interpret a mathematical result back into the real world context. interpret

体现原因

题目本质是：

把数学比较结果解释回现实决策（买车选择）

例如：

计算判断：

- Bolte：
  - Year = 2000 ✔
  - Price = 4450 ✔
  - Distance = 115000 ✔

因此得到数学结论：

Bolte 满足条件

学生需要解释为：

👉 **Chris 应该购买 Bolte 这辆车**

这体现了：

数学结论 → 现实选择

3️⃣ Interpret 2

Identify whether a mathematical result makes sense given the context of a problem. interpret

体现原因

学生在选择车辆时，需要判断：

该结果是否**符合题目设定的现实条件。**

例如：

Castel：

- 距离 = 128000 km

超过限制：

120000 km

因此必须判断：

👉 该车不符合现实需求。

这体现了：

根据问题情境判断结果合理性。

4️⃣ Interpret 9

Understand the relationship between the context of the problem and representation of the mathematical solution. interpret

体现原因

题目把现实问题（买车）转化为：

表格数据表示

学生需要理解：

现实条件 → 数学条件

例如：

现实需求	数学表达
不超过120000公里	distance ≤120000
2000年以后	year ≥2000
价格不超过4500	price ≤4500

学生通过理解这种关系来解释数据。
