1. **Item 7: Manipulate numbers, graphical and statistical data and information, algebraic expressions and equations, and geometric representations**
   The question requires students to directly handle numerical data from the table (engine capacity) and identify the smallest value by comparing decimal numbers. This directly corresponds to the requirements of "manipulating numbers" and "handling statistical information."
2. **Item 1: Perform a simple calculation**
   Although comparing sizes is not a standard arithmetic operation, it can be considered a basic numerical judgment, falling within the scope of fundamental calculation. Students need to sort four decimal numbers, which is essentially a simple comparison process.
3. **Item 5: Understand and utilise constructs based on definitions, rules and formal systems including employing familiar algorithms**
   Comparing decimals requires following clear rules (e.g., compare the integer part first, then compare decimal places digit by digit). This involves understanding and applying mathematical rules and algorithms, even though the algorithm used here is very simple.
4. **Item 10: Make sense of, relate and use a variety of representations when interacting with a problem**
   The question presents data in a table format. Students must understand the table's structure (rows and columns corresponding to different attributes) and extract the required information from it. This demonstrates the ability to understand and use various representations (in this case, a table).
5. **Item 13: Use an understanding of the context to guide or expedite the mathematical solving process**
   The context of the question is choosing a first car. However, this context does not substantially influence the comparison process itself; it merely provides a real-world meaning for the data. Students might use common sense to understand that "engine capacity" is a numerical value to be compared, so there is a slight connection, but the relevance is weak.

1. **第7条：Manipulate numbers, graphical and statistical data and information, algebraic expressions and equations, and geometric representations**
   题目要求学生直接处理表格中的数值（发动机容量），通过比较小数大小找出最小值。这完全对应“操纵数字”和“处理统计信息”的要求。
2. **第1条：Perform a simple calculation**
   虽然比较大小不是典型的算术运算，但可视为一种简单的数值判断，属于基础计算范畴。学生需对四个小数进行排序，本质上是一个简单的比较过程。
3. **第5条：Understand and utilise constructs based on definitions, rules and formal systems including employing familiar algorithms**
   比较小数需要遵循明确的规则（如先比整数部分，再逐位比较小数部分），这涉及对数学规则和算法的理解与应用，尽管算法非常简单。
4. **第10条：Make sense of, relate and use a variety of representations when interacting with a problem**
   题目以表格形式呈现数据，学生需理解表格的结构（行、列对应不同属性），并从中提取所需信息，这体现了对多种表示（表格）的理解和运用。
5. **第13条：Use an understanding of the context to guide or expedite the mathematical solving process**
   题目背景是选车，但上下文并未对比较过程产生实质性影响，仅提供了数据的现实意义。不过，学生可能借助常识理解发动机容量是数值，从而聚焦于比较，因此有一定关联，但相关性较弱。
