1. **Perform a simple calculation**
   The question requires calculating 2.5% of the advertised price of the Alpha car, which is 4800 × 0.025 = 120. This is a direct percentage multiplication operation and falls under the most basic calculation tasks.
2. **Understand and utilise constructs based on definitions, rules and formal systems including employing familiar algorithms**
   Percentage calculation is a fundamental mathematical rule. It requires understanding the definition of "percentage" and applying the multiplication algorithm to find the solution.
3. **Implement a given strategy to determine a mathematical solution**
   The question clearly provides the strategy: pay 2.5% of the advertised price as taxes. One simply needs to follow this strategy to perform the calculation.
4. **Manipulate numbers, graphical and statistical data and information**
   Extracting Alpha's advertised price (4800) from the table involves handling statistical data, followed by performing a numerical operation.
5. **Use an understanding of the context to guide or expedite the mathematical solving process**
   Understanding that the "tax" is a percentage of the advertised price helps in correctly selecting the relevant number (4800) and the appropriate operation (multiplication).
6. **Articulate a solution, showing and/or summarising and presenting intermediate mathematical results**
   Although the question only requires filling in the final answer, the solution process implicitly involves intermediate steps (like identifying the price and performing the calculation), with the final result presented as a numerical value.

1. **Perform a simple calculation**（执行简单计算）
   题目要求计算Alpha汽车广告价格的2.5%作为税费，即4800 × 0.025 = 120，这是一个直接的百分比乘法运算，属于最基本的计算任务。
2. **Understand and utilise constructs based on definitions, rules and formal systems including employing familiar algorithms**（理解并运用基于定义、规则和形式系统的构造，包括使用熟悉的算法）
   百分比计算是数学中的基本规则，需要理解“百分比”的定义并运用乘法算法来求解。
3. **Implement a given strategy to determine a mathematical solution**（实施给定策略以得出数学解）
   题目明确给出了策略：支付广告价格的2.5%作为税费，只需按照该策略执行计算即可。
4. **Manipulate numbers, graphical and statistical data and information**（操作数字、图形和统计数据及信息）
   从表格中提取Alpha的广告价格（4800）属于处理统计数据，然后进行数值运算。
5. **Use an understanding of the context to guide or expedite the mathematical solving process**（利用对上下文的理解来指导或加快数学求解过程）
   理解“税费”是基于广告价格的百分比，这有助于正确选择计算对象和运算方式。
6. **Articulate a solution, showing and/or summarising and presenting intermediate mathematical results**（阐述解决方案，展示或总结中间数学结果）
   虽然题目只要求填写最终答案，但解答过程中隐含了中间步骤（如识别价格和计算），最终以数值形式呈现结果。
