1st: Aspect 1 (Perform a simple calculation)

- **Analysis:** This is the most direct requirement of the problem. The student needs to execute a basic multiplication: multiplying the price of the Alpha (4800 zeds) by the tax rate (2.5% or 0.025). This is a textbook example of a single-step simple calculation. (p. 1)

2nd: Aspect 3 (Implement a given strategy to determine a mathematical solution)

- **Analysis:** The "strategy" is explicitly provided in the text: "pay an extra 2.5% of the advertised cost... as taxes." The student does not need to devise a strategy; they simply need to accurately implement the one given to find the solution. (p. 1)

3rd: Aspect 7 (Manipulate numbers... and information)

- **Analysis:** The student must engage in "data manipulation" across multiple types of information. They need to locate the "Alpha" column and the "Advertised price" row, extract the number 4800, and mathematically combine it with the 2.5% figure provided in the text. (p. 1)

4th: Aspect 10 (Make sense of, relate and use a variety of representations)

- **Analysis:** This involves integrating different forms of information. The student must relate the textual condition ("2.5% taxes") to the numerical data presented in the table. Success depends on making sense of how these different representations (text vs. table) interact. (p. 1)

第一位：方面 1 (Perform a simple calculation)

- **分析：** 这是本题最直接的要求。学生需要执行一个简单的乘法运算：将 Alpha 的价格（4800 zeds）乘以税率（2.5% 或 0.025）来得出结果。这是一个典型的单步简单计算 (p. 1)。

第二位：方面 3 (Implement a given strategy to determine a mathematical solution)

- **分析：** 题目已经明确给出了“策略”，即“额外支付广告价格的 2.5% 作为税费”。学生不需要自己寻找解题思路，只需准确地执行（Implement）这一既定策略即可 (p. 1)。

第三位：方面 7 (Manipulate numbers... and information)

- **分析：** 学生必须在表格的多种信息中进行“数据处理”。他们需要定位到“Alpha”列和“Advertised price”行，提取出数字 4800，并将其与 2.5% 这个百分比信息进行数学结合（即相乘）(p. 1)。

第四位：方面 10 (Make sense of, relate and use a variety of representations)

- **分析：** 学生需要理解表格这种表达方式，并将文本中的“2.5% taxes”这一条件与表格中的数值联系起来。这涉及到对不同信息呈现形式（文本描述与表格数据）的整合与利用 (p. 1)。
