1️⃣ Descriptor 9 (Most Relevant)

> **Understand the relationship between the context of the problem and the representation of the mathematical solution. Use this understanding to help interpret the solution in context and gauge the feasibility and possible limitations of the solution.**

How it is reflected:

- Students must understand that:
  - Each group of bars represents one month
  - Different colours/shadings represent different bands
  - The vertical axis represents the number of CDs sold
- The contextual information "April" and "The Metalfolkies" must be correctly mapped to the **appropriate bar** on the graph.

✅ **This is the core competency assessed by the question.**

2️⃣ Descriptor 5

> **Interpret mathematical outcomes in a variety of formats in relation to a situation or use; compare or evaluate two or more representations in relation to a situation.**

How it is reflected:

- Students convert data from a **graphical representation (bar chart)**
- Into a **numerical value**
- And then match it with **verbal/numerical answer options** (250, 500, 1000, 1270)

Although no comparison between multiple graphs is required, the task still involves **translating between representations** (graph → number → option).

3️⃣ Descriptor 1

> **Interpret a mathematical result back into the real-world context.**

How it is reflected:

- The student interprets the value read from the graph (approximately **500 CDs**)
- As a contextual statement:

  > "The Metalfolkies sold about 500 CDs in April."

This is a **basic level of contextual interpretation**, with no further inference required.

4️⃣ Descriptor 7

> **Construct and communicate explanations and arguments in the context of the problem.**

How it is reflected (implicitly):

- In class discussion or written justification, a student may explain:

  > "The bar for The Metalfolkies in April reaches 500, so the correct answer is B."

⚠️ However, in a multiple-choice format:

- An explicit explanation is **not required**
- This competency is **implicit rather than directly assessed**

5️⃣ Descriptor 8

> **Recognise [demonstrate, interpret, explain] the extent and limits of mathematical concepts and mathematical solutions.**

How it is reflected (to a very limited extent):

- Students need to recognise that:
  - The value read from the graph is an **approximate reading**
  - Extremely precise values (e.g. 1270) are therefore unreasonable

The question does **not explicitly require reflection on limitations**, so this descriptor plays only a minor role.

① 第 9 条（最核心）

> **Understand the relationship between the context of the problem and representation of the mathematical solution.**

体现方式：

- 学生必须理解：
  - 图中每一组柱子代表一个月份
  - 不同颜色/填充代表不同乐队
  - 纵轴代表“CD 销量（number of CDs sold）”
- “April + The Metalfolkies”这一现实语境信息
  ⟶ 映射到统计图中的**具体一根柱子**

✅ **这是本题的核心能力要求**

---

② 第 5 条

> **Interpret mathematical outcomes in a variety of formats … compare or evaluate representations**

体现方式：

- 将**图像形式的数据（柱状图）**
- 转化为**具体数值**
- 再与**文字选项（250 / 500 / 1000 / 1270）**进行匹配

虽然没有多种图表之间的比较，但**“图像 → 数值 → 语言/选项”**已经构成表征转换。

---

③ 第 1 条

> **Interpret a mathematical result back into the real world context**

体现方式：

- 学生读取的结果（约 **500 CDs**）
- 被解释为：

  > “The Metalfolkies 在四月份卖出了大约 500 张 CD”

这是一个**基础层面的情境解释**，不涉及进一步推论。

④ 第 7 条

> **Construct and communicate explanations and arguments in the context of the problem**

体现方式（隐含）：

- 在课堂或书面作答中，学生可能需要说明：
  > “因为 The Metalfolkies 在 April 的柱子高度对应 500，所以选 B。”

⚠️ 但在选择题结构中：

- **并不强制要求解释**
- 该能力是**潜在的，而非显性考查**

---

⑤ 第 8 条

> **Recognise the extent and limits of mathematical concepts and solutions**

体现方式（非常有限）：

- 学生需要理解：
  - 图表给的是**近似读数**
  - 并非精确到个位（例如 1270 这种选项）

但题目本身**没有引导学生反思“限制”**，只是最低程度的识别。
