1. Point 5: Interpret mathematical outcomes in a variety of formats in relation to a situation or use

- **Highly Relevant**: The question requires students to compare the sales data of two lines (No One's Darling and The Kicking Kangaroos) on the graph and determine the month when one *first surpassed* the other. This requires them to understand the relative change in data from a graphical "mathematical representation" and relate it to the real-world context of "sales comparison."
- **Concrete Manifestation**: Students must locate the two lines in the multi-line chart, observe where they intersect or change relative position, identify the first crossover point in time, and match it to the given month options.

---

2. Point 2: Identify whether a mathematical result or conclusion does, or does not, make sense given the context

- **Relevant**: The question asks for the "first time" one band outsold the other. This requires students to judge from the graph whether a true "surpassing" actually occurred—not just a close approach or a brief near-match followed by falling behind again. This involves assessing the reasonableness of the graphical result.
- **Concrete Manifestation**: Students may need to rule out misinterpretations such as "Did they already surpass in March?" or "Was April just close?" They must confirm the actual crossover point (which might be in April or May) and compare it with the choices.

---

3. Point 1: Interpret a mathematical result back into the real world context

- **Relevant**: Translating the relative relationship between the two lines on the graph into the real-world business comparison scenario of "one band's sales first exceeding another band's sales."
- **Concrete Manifestation**: After identifying the crossover point on the graph, students must interpret it as "from this month onward, the latter's sales are higher than the former's" and match it to the real-world month options A, B, C, D.

4. Point 9: Understand the relationship between the context of the problem and representation of the mathematical solution

- **Relevant**: The core of the problem is to "compare the sequence of sales," which is presented using a multi-line graph. Students must understand that in the graph, "line height" corresponds to "sales volume," and "line intersection" corresponds to "overtaking."
- **Concrete Manifestation**: Knowing that the y-axis represents sales, the x-axis represents time, and using this correspondence to correctly interpret the comparative result.

5. Point 7: Construct and communicate explanations and arguments in the context of the problem

- **Relevant**: Although students are not required to write out their reasoning, they internally perform reasoning while solving: "In March, No One's Darling was still below The Kicking Kangaroos; by April, it was higher, so the first surpassing happened in April (or May)." This internal reasoning constitutes implicit explanation and argumentation.
- **Concrete Manifestation**: Even in a multiple-choice setting, students must base their choice on an explanation derived from the graph (even if it's internal reasoning), reflecting their ability to explain data relationships.

---

6. Point 3: Identify the limits of the model used to solve a problem

- **Relevant**: The graph is a line chart connecting discrete points (monthly data). The actual sales might have fluctuated within a month, possibly crossing earlier, but the chart only shows end-of-month or total monthly figures. Therefore, the "first surpassing" identified from the graph is based on monthly data and may differ from daily data.
- **Concrete Manifestation**: Students must understand the model's limitation: this graph can only determine "in which month the former began to consistently exceed the latter" (or exceeded in that month's total/average value), but cannot pinpoint a finer time unit.

---

7. Point 8: Recognise the extent and limits of mathematical concepts and mathematical solutions

- **Relevant**: This question involves the concepts of "comparison" and "first time" as represented in the graph. The crossover might occur between two months, but data points are only for whole months, so the answer must be the whole month closest to the correct time. This also reflects an awareness of the precision of graph interpretation.
- **Concrete Manifestation**: Students need to know that the "time of surpassing" read from the graph is approximate to the month; it may not be possible to tell from the graph whether the surpassing happened at the beginning or end of the month.

1. 第 5 点：Interpret mathematical outcomes in a variety of formats in relation to a situation or use

- **高度相关**：题目要求学生比较两条折线（No One's Darling 与 The Kicking Kangaroos）的销售数据，并确定"第一次超过"的月份。这需要他们在图表这种"数学表示"中理解数据的相对变化，并联系到"实际销售比较"这一情境。
- **具体体现**：学生在多线图中定位两条线，观察交点或相对位置变化，并找出第一次交叉的时间点，将其对应到月份选项。

---

2. 第 2 点：Identify whether a mathematical result or conclusion does, or does not, make sense given the context

- **相关**：题目问的是"第一次超过"，这就要求学生在观察图表时必须判断是否真正发生"超过"，而不是接近或短暂接近后又低于。这涉及到对图形结果的合理性判断。
- **具体体现**：学生可能需要排除"三月是否已经超过"或"四月是否只是接近"等误判，必须确认真正交叉的位置（可能在四月或五月），并与选项比较。

---

3. 第 1 点：Interpret a mathematical result back into the real world context

- **相关**：将图表中两条线的相对关系转化为"某乐队销量第一次超过另一乐队"的实际商业比较情境。
- **具体体现**：从图表看到交叉点后，要理解为"在该月后者的销量高于前者"，并对应到 A、B、C、D 的现实月份选项。

---

4. 第 9 点：Understand the relationship between the context of the problem and representation of the mathematical solution

- **相关**：题目的核心是"比较销量先后"，这一现实问题是用多线图来呈现的。学生要理解图表中"线的高低"对应"销量多少"，"线的交叉"对应"超越"。
- **具体体现**：知道在图中纵轴表示销量，横轴表示时间，并利用此对应关系正确解读比较结果。

5. 第 7 点：Construct and communicate explanations and arguments in the context of the problem

- **相关**：虽然没有要求学生写出论证过程，但学生做题时内心会进行推理："在三月 No One's Darling 还低于 The Kicking Kangaroos，在四月已经更高了，所以第一次超过是在四月（或五月）"，这种推理即隐含的解释与论证。
- **具体体现**：在选择题环境下，学生仍需要对自己的选择给出基于图表的解释（即便是内心推理），这反映了解释数据关系的能力。

---

6. 第 3 点：Identify the limits of the model used to solve a problem

- **相关**：图表是离散点（月度数据）连成的折线，可能真实销量波动在月内已经发生超越，但图表只能显示月末或月总量，因此"第一次超过"在图表上是基于月度数据，可能和日度数据有差异。
- **具体体现**：学生需理解模型限制：这图只能判断"在哪个月开始前者持续高于后者"（或在该月总量/值上超越），不一定能精确到更细的时间单位。

---

7. 第 8 点：Recognise the extent and limits of mathematical concepts and mathematical solutions

- **相关**：此题涉及"比较"和"第一次"这两个概念在图表中的体现——交叉点可能出现在两月之间，但数据点只有整月，因此只能选择最接近正确答案的整月。这也是对图表解读精度的认知。
- **具体体现**：学生要知道从图表读取的"超越时间"是近似到月份的，可能无法从图上判断月初还是月末超越。
