1. Core Correlation: Point 4

> **Read, decode and make sense of statements, questions, tasks, objects or images to create a model of the situation**

- **Analysis:** This is the first and most crucial step in solving this problem. Students must read the text and **decode** key information: the start and end dates (July 1st to August 27th) and the total number of people (200,000). Students need to understand the logic behind these verbal descriptions to mentally construct a **situational model** of "Total Amount ÷ Time = Daily Average Amount".

---

2. High Correlation: Point 7

> **Simplify or decompose a situation or problem in order to make it amenable to mathematical analysis**

- **Analysis:** The problem **simplifies** a complex real-world scenario (varying daily climbers, weather impacts, etc.) into an "average calculation" problem. Students need to simplify the specific date range into a total number of days (31 days + 27 days = 58 days) to make it suitable for mathematical operations.

3. Moderate Correlation: Point 6 & Point 2

> **Identify and describe the mathematical aspects of a real-world problem situation including identifying the significant variables / Identify the key variables in a model**

- **Analysis:** Students need to identify the **key variables (Significant Variables)** from the text:
  - Variable A: Total number of people (200,000)
  - Variable B: Time span (58 days)
  - Target Variable: The average number of people per day.
    Identifying these variables is a prerequisite for mathematization of the real problem.

---

4. Moderate Correlation: Point 8

> **Recognise aspects of a problem that correspond with known problems or mathematical concepts, facts or procedures**

- **Analysis:** Students need to **recognize** that this problem corresponds to the known concepts of "average calculation" or "division application". By associating the learned mathematical procedure (the division formula), they link the real-world "number of mountain climbers" with the mathematical "dividend" and "divisor".

---

5. Light Correlation: Point 12

> **Identify the constraints, assumptions simplifications in a mathematical model**

- **Analysis:** The problem implies **assumptions**. Although the number of people varies daily in reality, for modelling purposes, the question asks for "On average", which is itself a simplification of the real situation.

1. 核心关联项：第 4 条

> **Read, decode and make sense of statements, questions, tasks, objects or images to create a model of the situation**

- **分析：** 这是解决此题的第一步，也是最关键的一步。学生必须阅读文本并**解码（Decode）关键信息：起止日期（7月1日至8月27日）和总人数（200,000人）(p. 1)。学生需要理解这些文字描述背后的逻辑，从而在大脑中构建出一个“总量 ÷ 时间 = 每日平均量”的情境模型。**

---

2. 高度关联项：第 7 条

> **Simplify or decompose a situation or problem in order to make it amenable to mathematical analysis**

- **分析：** 题目将一个复杂的现实情况（每天爬山人数不固定、天气影响等）**简化（Simplify）**为一个计算“平均值”的问题。学生需要将具体的日期跨度简化为总天数（31天 + 27天 = 58天），使之能够进行数学运算 (p. 1)。

---

3. 中度关联项：第 6 条 & 第 2 条

> **Identify and describe the mathematical aspects of a real-world problem... including identifying the significant variables / Identify the key variables in a model**

- **分析：** 学生需要从文本中识别出**关键变量（Significant Variables）**：
  - 变量 A：总人数（200,000）
  - 变量 B：时间跨度（58天）
  - 目标变量：每日平均人数 (p. 1)。
    识别这些变量是将现实问题数学化的前提。

4. 中度关联项：第 8 条

> **Recognise aspects of a problem that correspond with known problems or mathematical concepts, facts or procedures**

- **分析：** 学生需要**识别（Recognise）**出这个问题对应的是已知的“平均数计算”或“除法应用”的概念。通过联想已学的数学程序（除法公式），将现实中的“爬山人数”与数学中的“被除数”和“除数”建立联系。

---

5. 轻度关联项：第 12 条

> **Identify the constraints, assumptions simplifications in a mathematical model**

- **分析：** 题目隐含了**假设（Assumptions）**。虽然现实中每天人数不同，但为了建模，题目要求计算“On average”（平均），这本身就是一种对现实情况的简化处理 (p. 1)。
