1. Identify and describe the mathematical aspects of a real-world problem situation including identifying the significant variables (Point 6)

Analysis: This is the primary task. Students must translate the real-world concept of "renting DVDs" and "membership fees" into a mathematical cost-comparison problem. They need to identify that "covering the cost" means finding the point where the total savings from the lower rental fee equals or exceeds the initial fixed cost. (p. 1)

2. Identify the key variables in a model (Point 2)

Analysis: To solve this, students must extract the specific numerical values provided in the text and table:

- **Fixed Cost:** 10 zeds (Annual fee).
- **Variable A (Non-member):** 3.20 zeds per DVD.
- **Variable B (Member):** 2.50 zeds per DVD. (p. 1)

3. Read, decode and make sense of statements, questions, tasks, objects or images to create a model of the situation (Point 4)

Analysis: The student has to decode the tabular data and the text to understand that the "benefit" of being a member is the price difference ($3.20 - 2.50$). The mental model created is: **Savings per DVD $\times$ Number of DVDs $\geq$ Membership Fee**. (p. 1)

4. Recognise mathematical structure (including regularities, relationships, and patterns) in problems or situations (Point 5)

Analysis: This involves recognizing the **linear relationship** between the number of rentals and total cost. The student must recognize the relationship: $0.70x = 10$, where 0.70 is the constant rate of savings per unit. (p. 1)

5. Translate a problem into a standard mathematical representation or algorithm (Point 9)

Analysis: This is the execution phase. The student converts their logical understanding into a standard arithmetic algorithm:

1. Subtraction: $3.20 - 2.50 = 0.70$.
2. Division: $10 \div 0.70 \approx 14.28$. (p. 1)

6. Recognise aspects of a problem that correspond with known problems or mathematical concepts, facts or procedures (Point 8)

Analysis: Students likely relate this to previously learned "break-even" or "unit rate" problems, applying known procedures for division and subtraction to solve a typical real-world application question. (p. 1)

1. 识别并描述现实世界问题的数学方面（第 6 项）

分析： 这是解题的第一步。学生必须从租金描述中识别出这是一个**成本比较**问题。需要将“非会员租金”、“会员租金”和“会员费”这三个现实概念转化为数学量（变量），并意识到“抵消会费”意味着寻找两类人群总成本之间的差值 (p. 1)。

2. 识别模型中的关键变量（第 2 项）

分析： 题目直接提供了关键数据。学生需要准确提取出三个核心变量：

- **固定成本：** 10 zeds（会员费）。
- **变动成本 A：** 3.20 zeds/张（非会员）。
- **变动成本 B：** 2.50 zeds/张（会员）(p. 1)。

3. 阅读、解码并理解陈述、问题或图像以建立情境模型（第 4 项）

分析： 学生必须阅读文本并解码表格信息，理解“节省的费用”是由于单价差异产生的。建立的模型是：**单张 DVD 节省的费用 × 租赁数量 ≥ 会员费** (p. 1)。

4. 识别问题中的数学结构（第 5 项）

分析： 学生需要识别出其中的**线性增长关系**和**等量/不等量关系**。数学结构体现为：$0.70x = 10$（其中 0.70 是 3.20 与 2.50 的差值），这反映了对数量关系的规律性认识 (p. 1)。

5. 将问题转化为标准的数学表示或算法（第 9 项）

分析： 这是具体的执行阶段。学生将逻辑转化为计算步骤：

1. 计算差价：$3.20 - 2.50 = 0.70$。
2. 执行除法算法：$10 \div 0.70 \approx 14.28$ (p. 1)。

6. 识别与已知问题或数学概念相关的方面（第 8 项）

分析： 学生会联想到以前学过的“盈亏平衡点”或“单位比率”概念，利用已知的除法和减法程序来解决这类典型的应用题 (p. 1)。
