1. Indicator 6: Identify and describe the mathematical aspects of a real-world problem situation, including identifying the significant variables

- Highly relevant.
  Students must identify two key variables:
  - Number of rentals (denoted as x)
  - Total cost (member vs. non-member)

  They also need to interpret the phrase "offset the membership fee"—meaning the member's total cost ≤ non-member's total cost—leading to an inequality model.

---

2. Indicator 1: Select a mathematical description or representation that describes a problem

- Highly relevant.
  Students must translate the word problem into an inequality model:

$$10 + 2.50x \leq 3.20x$$

This is a classic example of using algebra to represent a real-world scenario.

---

3. Indicator 9: Translate a problem into a standard mathematical representation or algorithm

- Highly relevant.
  The inequality above serves as the standard mathematical representation, and solving it (e.g., by rearranging terms and dividing) involves basic algebraic procedures—an essential step in the modeling process.

---

4. Indicator 2: Identify the key variables in a model

- Moderately to highly relevant.
  Although overlapping with Indicator 6, this focuses more specifically on distinguishing variables (e.g., number of rentals, unit prices, fixed fees) from constants. The problem provides numerical values, and students must discern which quantities vary and which remain fixed.

5. Indicator 7: Simplify or decompose a situation or problem to make it amenable to mathematical analysis

- Moderately relevant.
  The problem is already highly simplified (only rental fees and membership fee are considered; other real-world factors like time or inventory are ignored). Nevertheless, students must disregard irrelevant details (e.g., mention of "computer games," which play no role in the calculation) and focus on core cost comparisons.

---

6. Indicator 12: Identify the constraints, assumptions, and simplifications in a mathematical model

- Moderately relevant.
  Implicit assumptions include:
  - Members and non-members rent the same number of DVDs;
  - Rental prices remain constant;
  - No other fees or discounts apply.

  Although the problem does not explicitly ask students to discuss these assumptions, the modeling process inherently relies on accepting such simplifications.

1. 第6条：Identify and describe the mathematical aspects of a real-world problem situation including identifying the significant variables

（识别并描述现实问题中的数学要素，包括关键变量）

- 高度相关。
  题目中学生需识别两个关键变量：
  - 租赁数量（设为 x ）
  - 总成本（会员 vs 非会员）

  同时要理解“覆盖会员费”的含义——即会员总支出 ≤ 非会员总支出，从而引出不等式模型。

---

2. 第1条：Select a mathematical description or a representation that describes a problem

（选择能描述问题的数学表达或表示方式）

- 高度相关。
  学生需将文字问题转化为一个不等式模型：

$$10 + 2.50x \leq 3.20x$$

这是典型的用代数表达现实问题的过程。

---

3. 第9条：Translate a problem into a standard mathematical representation or algorithm

（将问题转化为标准的数学表示或算法）

- 高度相关。
  上述不等式即为标准数学表示，后续求解（如移项、除法）属于基本代数算法。这一步是建模的核心转化环节。

---

4. 第2条：Identify the key variables in a model

（识别模型中的关键变量）

- 中高相关。
  虽然与第6条有重叠，但此处更聚焦于“变量本身”（如租赁次数、单价、固定费用），而非整个数学结构。题目明确提供了数值，学生需判断哪些是变量、哪些是常量。

5. 第7条：Simplify or decompose a situation or problem in order to make it amenable to mathematical analysis

（简化或分解问题，使其适合数学分析）

- 中等相关。
  题目已高度简化（仅考虑租赁费和会员费，忽略其他现实因素如时间、库存等），但学生仍需忽略无关信息（如“电脑游戏”被提及但未参与计算），聚焦核心成本比较。

---

6. 第12条：Identify the constraints, assumptions, simplifications in a mathematical model

（识别模型中的约束、假设与简化）

- 中等相关。
  隐含假设包括：
  - 会员与非会员租赁同一数量DVD；
  - 租赁价格恒定；
  - 不考虑其他费用或优惠。

  虽然题目未要求显式讨论这些假设，但建模过程默认接受这些简化。
