1. **Point 5: Interpret mathematical outcomes in a variety of formats in relation to a situation or use; compare or evaluate two or more representations in relation to a situation**
   The question presents one front view and four back views. Students need to compare these different two-dimensional representations to determine which one is consistent with the original model. This directly involves comparing and evaluating different representations of the same object from different perspectives, which is the core of the assessment.
2. **Point 9: Understand the relationship between the context of the problem and representation of the mathematical solution. Use this understanding to help interpret the solution in context and gauge the feasibility and possible limitations of the solution**
   The garage model has a specific structure (one window and one door), and the views are observed from the front and the back. Students need to understand how these views reflect the spatial relationship of the actual object (such as left-right reversal, front-back correspondence), thereby connecting the contextual information with the graphical representation.
3. **Point 1: Interpret a mathematical result back into the real world context**
   Although there is no explicit mathematical calculation here, the graphics themselves are a form of mathematical model. Students need to interpret the two-dimensional drawings as the three-dimensional form of an actual garage and identify the positional relationship between the window and the door. This reflects the ability to return from an abstract representation to a specific context.
4. **Point 8: Recognise [demonstrate, interpret, explain] the extent and limits of mathematical concepts and mathematical solutions**
   This problem implicitly involves the concept of perspective transformation. Students need to be aware of the correspondence between the front view and the back view (such as mirror imaging left and right) and understand the rules and limitations of this transformation, for example, that the relative positions of the window and door may be reversed when viewed from the back.

1. **第5点：使用多种格式解释数学结果，比较或评估不同表示**
   题目中给出了一个正面视图和四个背面视图，学生需要比较这些不同的二维表示，判断哪一个与原始模型一致。这直接涉及对同一物体的不同视角表示进行对比和评估，是核心考察点。
2. **第9点：理解问题背景与数学表示之间的关系**
   车库模型具有特定的结构（一个窗户和一个门），并且视图是从正面和背面观察的。学生需要理解这些视图是如何反映实际物体的空间关系（如左右反转、前后对应），从而将背景信息与图形表示联系起来。
3. **第1点：将数学结果解释回现实世界背景**
   虽然这里没有显式的数学计算，但图形本身是一种数学模型。学生需要将二维图形解释为实际车库的三维形态，并识别出窗户和门的位置关系，这体现了从抽象表示回归具体情境的能力。
4. **第8点：认识数学概念的范围和限制**
   该问题隐含了视角变换的概念，学生需要意识到正面视图与背面视图之间的对应关系（如左右镜像），理解这种变换的规律及其局限性，例如窗户和门的相对位置在背面可能相反。
