1. **Item 5: Understand and utilise constructs based on definitions, rules and formal systems including employing familiar algorithms**
   Students must grasp the definition of average speed (average speed = total distance ÷ total time). This is the core rule for solving the problem, and correctly applying this definition is essential to arrive at the answer.
2. **Item 1: Perform a simple calculation**
   The question requires completing basic arithmetic operations: first calculating the total distance (4 km + 3 km = 7 km), then the total time (9 min + 6 min = 15 min), and finally performing division (7 km ÷ 0.25 h = 28 km/h). These are all simple calculations.
3. **Item 13: Use an understanding of the context to guide or expedite the mathematical solving process, e.g. working to a context-appropriate level of accuracy**
   It is necessary to understand the practical meaning of "average speed" in the context of cycling and pay attention to unit consistency. The time in the problem is given in minutes, but the speed is required in km/h. Therefore, minutes need to be converted to hours (15 min = 0.25 h). This demonstrates the ability to handle the problem appropriately within its real-world context.
4. **Item 7: Manipulate numbers, graphical and statistical data and information, algebraic expressions and equations, and geometric representations**
   Students need to process the given distance and time data, perform addition and division, and complete unit conversion (minutes to hours). This involves basic manipulation and conversion of numbers.
5. **Item 12: Use a multi-step procedure leading to a mathematical solution, conclusion or generalisation**
   The problem-solving process involves multiple steps: first calculating the total distance and total time separately, then converting the time units, and finally using division to find the average speed. Although the steps are simple, they still demonstrate a process of multi-step reasoning.

1. **第5条：理解并利用基于定义、规则和形式系统的构造，包括使用熟悉的算法**
   学生必须掌握平均速度的定义（平均速度 = 总路程 ÷ 总时间），这是解题的核心规则，正确应用该定义才能得出答案。
2. **第1条：执行简单计算**
   题目需要完成基本的算术运算：先求总路程（4 km + 3 km = 7 km），再求总时间（9 min + 6 min = 15 min），最后进行除法（7 km ÷ 0.25 h = 28 km/h），这些都属于简单计算。
3. **第13条：使用对上下文的理解**
   理解“平均速度”在骑行情境中的实际意义，并注意单位一致性：题目中时间以分钟给出，而速度要求以 km/h 表示，因此需要将分钟转换为小时（15 min = 0.25 h），这体现了结合实际问题进行合理处理的能力。
4. **第7条：操作数字、图形和统计数据**
   学生需处理给定的距离和时间数据，进行加法和除法运算，并完成单位换算（分钟到小时），涉及对数字的基本操作和转换。
5. **第12条：使用多步程序**
   解题过程包含多个步骤：先分别计算总路程和总时间，再将时间单位转换，最后用除法求平均速度。尽管步骤简单，但仍体现了多步推理的流程。
