**12. Use a multi-step procedure leading to a mathematical solution... (Relevance: Very High)**

This is the most defining characteristic of this problem. A student cannot find the answer with a single calculation; they must execute a logical sequence (p. 1):

1. Calculate total distance ($4 \text{ km} + 3 \text{ km} = 7 \text{ km}$).
2. Calculate total time ($9 \text{ min} + 6 \text{ min} = 15 \text{ min}$).
3. Apply the average speed formula ($\text{Total Distance}/\text{Total Time}$).
4. Convert the resulting rate from $\text{km/min}$ to $\text{km/h}$.

**5. Understand and utilise constructs based on definitions, rules... (Relevance: Very High)**

This tests the understanding of the specific definition of "average speed" for an entire trip. Students must know that it is the **total** distance divided by the **total** time, rather than just averaging the two individual speeds. It also requires utilizing the formal system of unit conversion (minutes to hours) (p. 1).

**1. Perform a simple calculation (Relevance: High)**

While the overall procedure is multi-step, each individual component involves basic arithmetic: addition to find totals, and division/multiplication to find the speed and perform conversions (p. 1).

**7. Manipulate numbers, graphical and statistical data... (Relevance: High)**

The student must extract four distinct numerical values from the text (two distances and two times) and manipulate them within a mathematical relationship to arrive at the final answer (p. 1).

**13. Use an understanding of the context to guide... (Relevance: Medium)**

Understanding the real-world context of a "round trip" (to the river and back) is essential for correctly identifying which values to aggregate. This prevents the student from only calculating the speed for one leg of the journey (p. 1).

**8. Articulate a solution, showing and/or summarising... (Relevance: Medium)**

As this is a fill-in-the-blank question involving several steps, students must organize their intermediate results (like total distance and total time) to ensure the final $\text{km/h}$ value is accurate (p. 1).

**12. Use a multi-step procedure leading to a mathematical solution... (相关性：极高)**

这是本题最显著的特征。学生不能通过单一计算得出答案，必须执行以下多个步骤：

1. 计算总距离（$4\ \text{km} + 3\ \text{km} = 7\ \text{km}$）。(p. 1)
2. 计算总时间（$9\ \text{min} + 6\ \text{min} = 15\ \text{min}$）。(p. 1)
3. 应用平均速度公式（$7\ \text{km}/15\ \text{min}$）。
4. 将结果从 km/min 转换为 km/h。

**5. Understand and utilise constructs based on definitions, rules... (相关性：极高)**

题目考察对“总平均速度”定义的深刻理解。学生必须明白总平均速度是“总距离除以总时间”，而不是简单地将两段路程的速度取平均值。同时，这涉及运用单位换算的正式系统（分钟到小时）。(p. 1)

**1. Perform a simple calculation (相关性：高)**

虽然过程是多步的，但每一步都涉及基础运算，如加法（求总和）和乘除法（求速度和单位换算）。

**7. Manipulate numbers, graphical and statistical data... (相关性：高)**

学生需要从文本描述中提取并操纵四组不同的数值（两个距离和两个时间），并将其代入代数关系式中进行处理。(p. 1)

**13. Use an understanding of the context to guide... (相关性：中)**

理解“往返”这一现实情境对于确定总路程和总时间至关重要。学生需要识别出题目要求的不是某一段的速度，而是整个行程的综合表现。(p. 1)

**8. Articulate a solution, showing and/or summarising... (相关性：中)**

由于这是一个填空题，学生通常需要在草稿纸上展示或整理中间计算结果（如总距离和总时间），以便最终得出准确的 km/h 数值。(p. 1)
