1. **Item 5: Understand and utilise constructs based on definitions, rules and formal systems including employing familiar algorithms**
   Students must understand the expert's evaluation rules: the base price is calculated at 2500 zeds per square meter, with additional value added based on travel time, distance to the beach, and the availability of a parking spot. Correctly applying these rules is the core of solving the problem.
2. **Item 1: Perform a simple calculation**
   The question requires basic arithmetic operations: first, calculate the base price by multiplying the area by the rate (60 × 2500 = 150,000). Then, sum the additional values based on the conditions (10,000 + 15,000 + 35,000 = 60,000) to arrive at a total estimated value of 210,000 zeds. These are all simple calculations.
3. **Item 12: Use a multi-step procedure leading to a mathematical solution, conclusion or generalisation**
   The problem-solving process involves multiple steps: first, calculate the base price; second, determine the additional value for each of the three criteria; third, sum these to get the total estimated value; and finally, compare this estimate with the advertised selling price to draw a conclusion. Each step must be performed in sequence.
4. **Item 13: Use an understanding of the context to guide or expedite the mathematical solving process, e.g. working to a context-appropriate level of accuracy**
   It is necessary to understand what "very good" means in this context: that the expert's estimate is higher than the advertised selling price. Additionally, one must correctly interpret the given time (10 minutes) and distance (350 meters) to apply the correct additional values (e.g., 10 minutes falls into the "5 to 15 minutes" range, adding 10,000; 350 meters is less than 0.5 km, adding 15,000).
5. **Item 7: Manipulate numbers, graphical and statistical data and information, algebraic expressions and equations, and geometric representations**
   Students need to process the given numerical data (area, time, distance) and perform addition, subtraction, multiplication, and division. While unit conversion (e.g., minutes to hours) is not required here as the time is judged by its range, the task still involves manipulating numbers.
6. **Item 6: Develop mathematical diagrams, graphs, constructions or computing artifacts and extracting mathematical information from them**
   The question includes an image (likely showing the advertised selling price or average usage rate). Students need to extract necessary information (such as the selling price) from this image to complete the comparison. Although the specific content of the image is unknown, the problem description indicates that this step is necessary.

1. **第5条：理解并利用基于定义、规则和形式系统的构造，包括使用熟悉的算法**
   学生必须理解专家给出的评估规则，即基础价格按每平方米2500 zeds计算，并根据旅行时间、距海滩距离、停车位情况增加额外价值。正确应用这些规则是解题的核心。
2. **第1条：执行简单计算**
   需要进行基本的算术运算：先计算面积乘以单价（60 × 2500 = 150000），再根据条件累加额外价值（10000 + 15000 + 35000 = 60000），得到总估价210000 zeds。这些都属于简单计算。
3. **第12条：使用多步程序**
   解题过程包含多个步骤：先计算基础价格，再分别判断三个附加条件对应的增加值，然后求和得到总估价，最后与广告售价比较得出结论。每一步都需要按顺序进行。
4. **第13条：使用对上下文的理解**
   需要理解“非常划算”在情境中的含义：即专家估价高于广告售价。同时，要注意时间（10分钟）和距离（350米）所属的范围，正确对应附加价值（例如10分钟属于5-15分钟区间，加10000；350米小于0.5km，加15000）。
5. **第7条：操作数字、图形和统计数据**
   处理给定的数字（面积、时间、距离）并进行加减乘除运算，同时可能涉及单位换算（如分钟与小时，但此处时间直接按分钟范围判断，无需换算）。此外，还需从题目中提取相关数据。
6. **第6条：制作或提取数学图表信息**
   题目中包含一个图片（可能显示广告售价或平均使用率），学生需要从该图片中提取必要的信息（如售价）来完成比较。尽管图片内容未知，但根据题目描述，这一步是必需的。
