12. Use a multi-step procedure leading to a mathematical solution... (Relevance: Very High)

This is the core requirement. Students must follow a logical chain of multiple steps: (p. 1)

1. **Calculate the base price:** $60 \text{ m}^2 \times 2500 \text{ zeds/m}^2 = 150,000 \text{ zeds}$.
2. **Identify and sum additional values:** Based on specific conditions (travel time, beach distance, parking), add $10,000 + 15,000 + 35,000 = 60,000 \text{ zeds}$.
3. **Calculate the total estimated value:** $150,000 + 60,000 = 210,000 \text{ zeds}$.
4. **Comparison:** Compare this total to the advertised price $(200,000)$ to reach a conclusion.

5. Understand and utilise constructs based on definitions, rules... (Relevance: Very High)

The problem provides a complete "system of rules" for the expert's evaluation. Students must strictly understand and utilize these defined rules (such as which price increments correspond to which distance intervals) and formal algorithms (price per unit $\times$ area) to solve the problem. (p. 1)

8. Articulate a solution, showing and/or summarising... (Relevance: High)

The prompt asks to "**Show that...**", which means a final answer alone is insufficient. Students must clearly articulate the solution, showing intermediate mathematical results (like the individual additional values and the total estimate) to summarize why the price is "very good." (p. 1)

10. Make sense of, relate and use a variety of representations... (Relevance: High)

Students need to process information from different formats: reading the **textual descriptions** of the apartment's features and analyzing the **tabular data** of the evaluation criteria, then relating them to perform the math. (p. 1)

7. Manipulate numbers, graphical and statistical data... (Relevance: Medium)

This involves manipulating the numerical and statistical information provided in the table, including processing different units and dimensions like area (m^2), currency (zeds), time (minutes), and distance (metres). (p. 1)

12. Use a multi-step procedure leading to a mathematical solution... (相关性：极高)

这是该题最核心的要求。学生必须按照预设的逻辑链条完成多个步骤：

1. 计算基础价格（$60\ \mathrm{m}^2 \times 2500\ \mathrm{zeds/m}^2 = 150,000\ \mathrm{zeds}$）(p. 1)。
2. 根据特定条件（交通时间、海滩距离、停车位）分别查找并累加附加价值（$10,000 + 15,000 + 35,000$）(p. 1)。
3. 计算总评估价值（$150,000 + 60,000 = 210,000\ \mathrm{zeds}$）(p. 1)。
4. 将总价值与广告售价（$200,000$）进行比较得出结论 (p. 1)。

5. Understand and utilise constructs based on definitions, rules... (相关性：极高)

题目给出了专家评估的一套完整“规则系统”。学生必须严格理解并利用这些定义的规则（如不同距离区间对应的加价金额）和正式的算法（单价 $\times$ 面积）来解决问题 (p. 1)。

8. Articulate a solution, showing and/or summarising... (相关性：高)

题干要求“Show that...（证明.....）”，这意味着学生不能只写一个最终答案，必须清晰地陈述解决方案，展示计算中间结果（如各项附加值和总估价），并总结为什么这个价格是“非常好的” (p. 1)。

10. Make sense of, relate and use a variety of representations... (相关性：高)

学生需要处理多种表征方式：阅读文本描述（公寓特征）、分析表格数据（评估标准），并将两者关联起来进行数学处理 (p. 1)。

7. Manipulate numbers, graphical and statistical data... (相关性：中)

涉及对表格中统计数据和数值信息的操纵，包括处理面积、金额、时间、长度等不同维度的数值 (p. 1)。

1. Perform a simple calculation (相关性：中)

虽然整体程序复杂，但其中的每个原子操作（如 60×2500 或加法运算）本质上是简单的基础运算。
